Regional Operations Center
Salt Lake City, UT*

WEATHER KEY POINTS

12/20/21 - 12/26/21

Monday - Sunday

- A very active weather pattern will be moving inland into California late Monday into Tuesday, and will persist through at least the weekend.
- On Monday and Tuesday during the onset of the event, snow levels will range between 3000 feet and 4500 feet across northern California, but may lower in the Trinity Alps Tuesday. By Wednesday, snow levels will rise to around 4500-6500 feet in the Sierra, then decrease again Thursday into Friday.
- Forecast rainfall amounts through Sunday morning:
 - 1 to 4 inches across the northern California valleys
 - 3 to 7 inches for the Sierra foothills, coastal northern California and most Bay Area Mountains
 - 6 to 9+ inches (water equivalent including snow) over the Sierra mountains
 - 0.5 inch to 1.25 inches in the San Joaquin Valley
 - 1 to 2 inches for Southern California, except for the Eastern Desert where less than 0.25 inch is expected
- Several feet of mountain snow are forecast above 7000 feet across the Sierra, with significant impact to mountain travel expected Tuesday through late week. Elevations down to 5000 feet will also see significant snowfall accumulations, but the rain/snow line will fluctuate during the event.
- For the San Joaquin and Southern California, the heaviest accumulations of rain and snow will occur Thursday and Friday.
 - There is low confidence on timing and amounts for Southern California at this time, but this event could be a moderate impact rain event, with snow at higher elevations.
 - An impact to the Grapevine is not anticipated at this time.
 - Moderate to brief heavy rain could create flooding and minor debris flows across Southern California Thursday and Friday.
- Snow may affect lower elevation passes down to 2000 feet on Christmas Eve and Day across far northern California, and may fall below 1000 feet on Sunday.
